

Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is a hydraulic device which could allow the individual driving to control the forklift without leaving the seat. They are constructed out of top quality materials and are meant to be able to withstand the most challenging procedures and work surroundings. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate much more precise lifting and position in a quicker and more efficient way.

The unique fork pocket design could enable the one operating it to be able to securely sway the unit's forks without any fear of damaging the positioning cylinders. This allows the worker the alternative to either execute simultaneous or independent fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into fork positioners on existing units.
